

How an proposer would use this Sample Catalog

The sample list contains the basic information of the samples as follows.

Sample name

A proposer would use this ID in specifying which samples to be analysed in a proposed investigation. When an ID is RA-QDx-y, it means that the sample has been retrieved from Room A by method (3) (dropping onto Quartz Disk).

Parent

The pdf file shows the information of parent particle before its break up.

Status

If a sample is not back at the curation facility, it would not be available for this AO.

Size

Size was measured by BSE image. All particles listed in the "Sample Catalog page" are available for 3rd AO.

Category

This column shows the results of initial description by the Curator. Category 1, 2 and 3 samples are available for AO at this stage.

Phase

This column shows the mineral phase determined in the initial description.

Analysis

This column shows analytical methods that the particle has been through during initial description by curators, preliminary examinations, and previous International AOs. Some of the past analyses may constrain the scope of meaningful future analysis to be proposed in AO.

Links to further information

When the above information allows a proposer to find a sample that matches the proposer's interest, further information can be inspected by following the links. Note that the files that can be accessed by clicking the two left-most columns are ~10MB in size.

How to operate

Category 1 and 2
